Overview

Introduction

For over 20 years, the South Carolina Aeronautics Commission (SCAC) has implemented an airfield pavement management program for publicly owned South Carolina airports. As part of their grant assurances federally obligated airports are required to perform detailed inspections as outlined in the FAA Advisory Circular 150/5380-7B – “Airport Pavement Management Program (PMP)”. All inspections performed within this program follow the guidance documented within the ASTM D5340-20 – “Standard Test Method for Airport Pavement Condition Surveys”. This is an objective process to assess the pavement condition in a consistent and repeatable manner.

Due to ever-changing pavement conditions, the FAA AC 150/5380-7B recommends the PMP be updated every 3 years. The overall pavement conditions are analyzed using the ASTM PCI methodology. It provides decision makers with a comparison of pavement facilities and a relative indication of their required maintenance or level of repair to aid in project prioritization. A detailed explanation of the SCAC airfield pavement management program process and pavement management terminology can be found in the [SCAC Statewide Report](#).

Project elements performed for the 2021-2024 program update included the development and update of pavement inventories, documentation of pavement conditions, performance modeling, and maintenance and rehabilitation (M&R) needs for all participating airports. This report summarizes the results of the SCAC pavement management program update at Greenville Downtown Airport (GMU).

Figure 1 – Airport Layout

STATEWIDE AIRFIELD PAVEMENT MANAGEMENT SYSTEM UPDATE

GMU - Greenville Downtown Airport

System Inventory

The pavements at Greenville Downtown Airport (GMU) include approximately 3.5 million square feet of airfield pavements consisting of runways, taxiways, and aprons. Per the guidance in the ASTM D5340-20, all pavements were divided and subdivided into pavement management units (Network, Branch, Section, Sample). The divisions are documented in the **Network Definition Exhibit** providing the name and location of each branch, section, and sample.

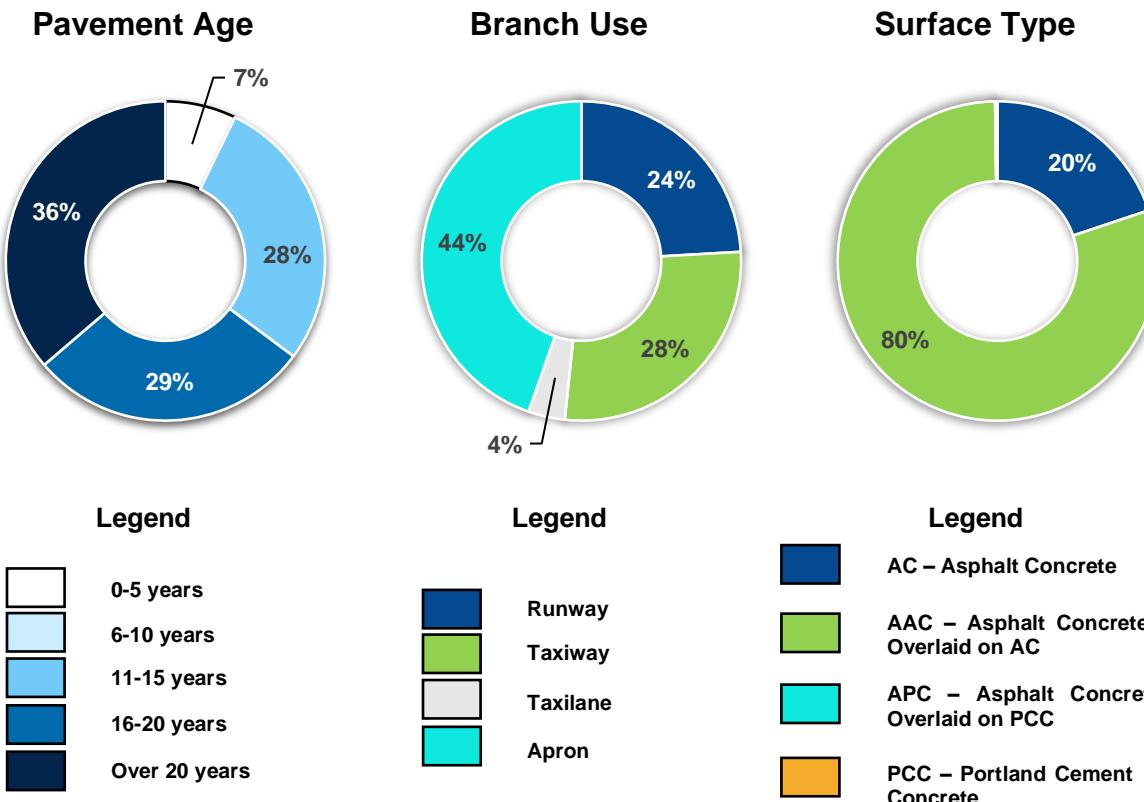

Each pavement update included a review of documentation of any maintenance and major rehabilitation related activities performed on the airfield pavements. The following table summarizes the projects that have occurred since the previous inspection.

Table 1 - Recent Airfield Pavement Construction

| Construction Year | Location | Work Type / Pavement Section |
|-------------------|--------------------------------------|---|
| 2019 | AP 03 | Crack Sealing - AC |
| 2021 | TW B, TW B1, TW B3, TW C, TW F, TW G | Mill and Overlay 1.5" Mill, 4" Overlay |
| 2021 | TW E | Mill and Overlay 2" Mill, 2" Overlay |
| 2021 | TW B5 | New Construction - AC 4" P-401, 10" P-209 |

The following figure summarizes the inventory items at Greenville Downtown Airport (GMU). The **Estimated Age Exhibit** provides the last major work date for each pavement section based on the collected documentation.

Functional Evaluation

Pavement Condition Index

A Pavement Condition Index (PCI) survey is the primary means of obtaining and recording pavement distress data. In adherence to FAA Advisory Circular 150/5380-7B, the SCAC Airfield Pavement Management System (APMS) Update utilizes the PCI survey methodology to collect pavement distress data and analyze the condition. This method uses a visual statistical sampling of pavements for recording primary distress types, associated severities, and quantities as defined by the ASTM D5340-20.

Visual condition data collected during the PCI survey is analyzed and used to calculate the current PCI for each inspected sample unit and section. The PCI is a value ranging from 0 to 100, which indicates the apparent structural integrity and surface operational condition of the pavement, with **“100” indicating a pavement in new condition and “0” indicating a failed pavement section**. Pavement Condition Ratings are associated with PCI categories that range from Failed to Good. Representative photos of varying Pavement Condition Ratings are displayed in **Figure 3**.

Figure 3 – Representation of Pavement Condition Index Values

Poor/Failed Pavement

Pavements that are Poor to Failed require significant and costly interventions such as reconstruction to restore the pavement to operational service.

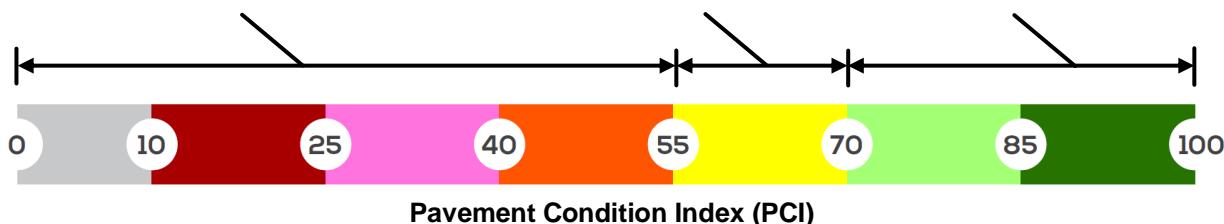

Fair Pavement

Pavements with a Fair condition rating typically require rehabilitation, or maintenance activities if rehabilitation cannot be immediately performed.

Good/New Pavement

Pavements classified as Good require either no treatment or would benefit from the application of preventive maintenance activities such as crack sealing. .

STATEWIDE AIRFIELD PAVEMENT MANAGEMENT SYSTEM UPDATE

 GMU - Greenville Downtown Airport

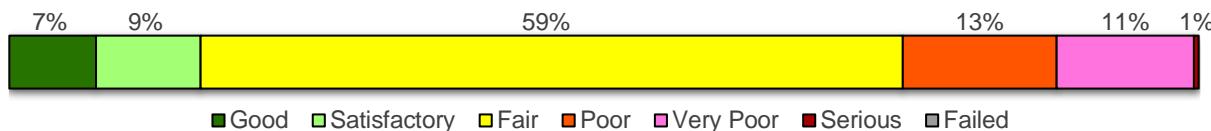

Critical PCI

From a pavement management perspective, one of the most valuable aspects of the PCI methodology is the ability to save money by effectively prioritizing the rehabilitation of pavement assets. Critical PCI refers to the condition beyond which the rate of pavement deterioration and the cost of applying a treatment increases significantly. In other words, it is the condition at which maintenance may no longer be cost effective and major rehabilitation should be considered. Based on the 2019 FAA Order 5100.38D Change 1 Airport Improvement Program Handbook, the FAA has established recommended PCI thresholds for pavement M&R. Accordingly, **the Critical PCI for all SCAC airfield pavements is defined at 70.**

PCI Results Summary

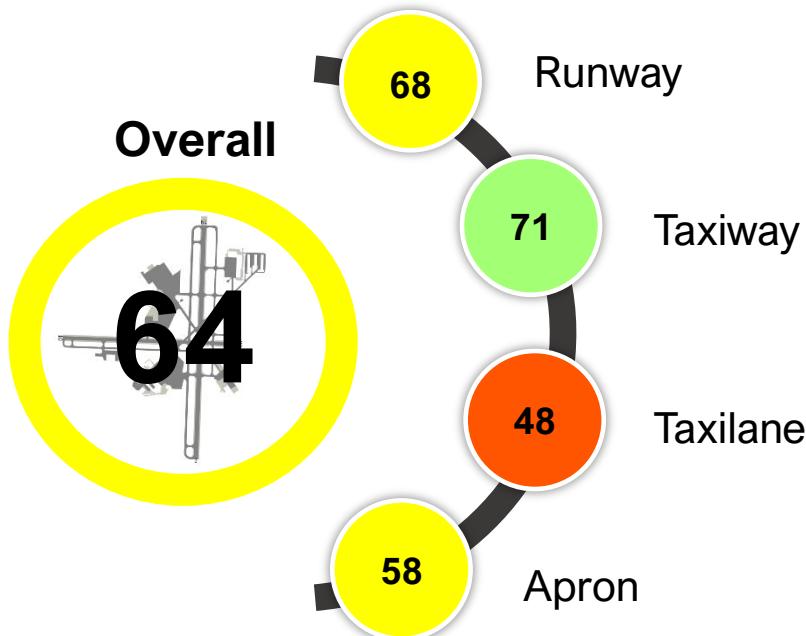

The PCI survey for Greenville Downtown Airport (GMU) was performed in October 2021. **The overall area-weighted average PCI value of the network was 64**, representing a condition rating of **Fair**. Approximately 16% of inspected pavements are in Good or Satisfactory condition, 59% of inspected pavements are in Fair condition, and the remaining 25% are in Poor or worse condition as summarized in **Figure 4**.

Figure 4 – Overall Network PCI Results

The area-weighted average PCIs by branch use are summarized in the figure below. The current PCIs at a section-level are displayed graphically on the **2021 Airfield Pavement Condition Index (PCI) Exhibit** and are summarized in **Table 2**.

*For further PCI details and photos see Appendix D – Detailed PCI Results.

Pavement Condition Forecast

A primary objective of this APMS is to estimate the future condition of each individual pavement section. PAVER™ was utilized to develop prediction curves and determine typical deterioration rates that are then used to forecast a future PCI value. This value will assist decision makers in determining at what point in time certain pavement sections will require rehabilitation. The figure below shows the current and 5-year area-weighted forecasted pavement condition distribution of each functional use (Runway, Taxiway, Taxilane, Apron) found at the Airport. The forecasted 5-year PCIs at a section-level are displayed graphically on the **2026 Forecasted Airfield Pavement Condition Index Exhibit** and are summarized in **Table 3**. All forecasts presented assume that no maintenance or rehabilitation is performed within the 5-year analysis period. **Figure 6** displays the forecasted pavement conditions at the branch-level for GMU.

Figure 6 – Forecasted 5-Year PCI by Branch Use

All condition forecasts are based on historical observations and analysis of South Carolina airfield pavements. The forecasts are not a guarantee of future PCI:- rather, they are a planning tool to aid in the timing of maintenance and rehabilitation activities.

M&R Overview

An analysis was performed to assess the pavement maintenance and rehabilitation (M&R) needs at GMU over a 5-year period. The analysis compared the forecasted condition of each pavement section to Critical PCI threshold to develop a resultant recommendation and associated cost for each year of the 5-year plan. The M&R analysis should enable responsible parties to do the following:

- **Maintain** existing airport infrastructure at an acceptable condition
- Make timely and cost-effective **decisions** to appropriately allocate funding
- **Apply** global maintenance, localized maintenance, and major M&R activities in a timely manner to maintain an acceptable operational condition of a pavement network.

M&R planning considers various methods of repair to address the cause of the problem rather than just treating the symptom. As pavements deteriorate, repair costs can increase significantly. Once pavements have deteriorated below a certain condition threshold (the Critical PCI value), the pavement benefits more from substantial rehabilitation in lieu of maintenance activities. The figure below illustrates how the cost of pavement repairs can exponentially increase if M&R activities are delayed.

Figure 7 – Pavement Life and the Effect of Treatments

Localized Maintenance and Repair

Localized maintenance is best used as a preservation measure and is applied to slow the rate of deterioration. These activities typically include crack sealing and patching. Localized maintenance differs from major rehabilitation in that it is applied based on the distresses observed rather than based on a PCI value. Treatments are selected based on the appropriate corrective measure for a given distress type and severity level. Localized maintenance applied on pavements with PCIs above the Critical PCI of 70 is known as Preventive Localized Maintenance, while Stopgap Localized Maintenance is typically applied to pavement sections that are at or below the Critical PCI value as a temporary repair due to safety concerns. The current localized maintenance needs are summarized in the table below.

Table 4 – Localized Maintenance Summary by Policy Type

| Localized Maintenance Category | Localized Work Type | Rough Estimate of Work Quantity | Work Units | Planning Material Cost |
|---|---------------------------|---------------------------------|------------|------------------------|
| Localized Preventive Maintenance | AC Crack Sealing Narrow | 30,011 | LF | \$ 120,060 |
| | Surface Seal | 550 | SF | \$ 500 |
| | PCC Joint Seal | 734 | LF | \$ 5,150 |
| Localized Preventive Maintenance Total = | | | | \$ 125,710 |
| Localized Stopgap Maintenance | AC Crack Sealing Narrow | 54,040 | LF | \$ 216,280 |
| | AC Crack Sealing Wide | 36 | LF | \$ 460 |
| | Surface Seal | 151,954 | SF | \$ 136,860 |
| | AC Partial-Depth Patching | 1,191 | SF | \$ 14,890 |
| | AC Full-Depth Patching | 7,985 | SF | \$ 221,650 |
| Localized Stopgap Maintenance Total = | | | | \$ 590,140 |
| Total Planning-Level Localized Maintenance Needs = | | | | \$ 715,850 |

Major Rehabilitation Needs

Major rehabilitation needs are identified by analyzing the Airport's pavement condition in relationship to Critical PCI values, density of load-related distresses, and major rehabilitation policies, assuming there are no budget constraints. The needs analysis is performed over a 5-year analysis period. Major rehabilitation resets the PCI value to 100 and is divided into two policy categories:

→ **Intermediate Major Rehabilitation (PCI 56 to 70) –**

- **AC:** Milling of the upper surface course and replacing with new AC with isolated areas of full-depth reconstruction
- **PCC:** Combination of crack sealing, joint seal replacement, limited patching, and slab replacement

→ **Full-Depth Reconstruction (PCI 0 to 55) –** Removal and replacement of the existing pavement section down to the subgrade

The 5-year major rehabilitation needs analysis at GMU results in a total 5-year cost of \$49.75M. The **5-Year Major Rehabilitation Needs Exhibit** graphically depicts the major

STATEWIDE AIRFIELD PAVEMENT MANAGEMENT SYSTEM UPDATE

GMU - Greenville Downtown Airport

rehabilitation needs at a section-level which are also summarized in **Table 5** with rounded costs. Annual needs are displayed graphically in **Figure 8**.

Table 5 – 5-Year Major Rehabilitation Needs
